Novel heterocyclically substituted amides, their preparation and use

## 5 Abstract

Amides of the general formula I

$$(R^2)_n \qquad Q \qquad R^3$$

$$R^1 - X \qquad H \qquad Q \qquad R^4$$

and their tautomeric and isomeric forms, possible enantiomeric and diastereomeric forms, as well as possible physiologically tolerable salts, in which the variables have the meanings stated 20 in the description, their preparation and use as calpain inhibitors.
